

# How To Fill

## Bottoms Up

While the Beer Tubes Experience is ultimately the same, filling a Bottoms Up Beer Tube has some unique instructions and components:

1

Be sure that you have a Bottoms Up magnet which was supplied with the Bottoms Up Beer Tube.

The magnet must be centered over the hole in the tube prior to filling. Be sure the magnet is seated right side up with the silicon seal down.

Replacement magnets are available from GrinOn.

2

The tube will separate from the coupler which should remain in the base during filling.

The tube should be placed on the Bottoms Up Dispenser for filling as per the instructions provided by GrinOn and your installer.

3

It is important that the white silicon washer remains on top of the coupler during use to prevent leakage. If the washer is removed for cleaning it must be replaced and if it is damaged it must be replaced with a new one.

Each tap comes with a plastic washer. Make sure the washer is secured over the tap threads before attaching the tap to the coupler. Multiple washers may be used to prevent leaking and align the tap on the coupler.

4

Simply align the threads of the tap to the coupler and screw in. The tap should fit tightly into the coupler. Do not overtighten.

The tube, coupler, base, and tap are interchangeable to simplify the process of filling and cleaning the tubes.

The full tube is placed on the coupler and the Bottoms Up Beer Tube is ready for your guests to enjoy!
